A Greenprint for Our Future: Miami-Dade County Street Tree Master Plan

Executive Summary

The urban forest is stressed in many cities around the country, but in Miami-Dade County our urban trees are in critical condition. A number of factors have contributed to the diminished tree cover in Miami-Dade, but the problem became even more significant after the tree destruction by the 2005 hurricanes, Katrina, Rita, and Wilma. Hurricanes and windstorms do not account for the entire deficit in tree cover. Further causes include development activities, increased impervious areas, and the removal of trees due to citrus canker.

Adequate tree canopy is vital to the environmental and economic well being of our community. Trees save money on our electric bills by shading homes, offices, and streets, resulting in a reduced need for the use of air conditioning. Trees reduce storm water runoff by intercepting rainfall through their leaves and branches and releasing it slowly and also actively removing water from the soil. National studies indicate that trees increase property values by 5-15 percent and make communities more visually and environmentally appealing. Trees improve air quality by absorbing pollutants and particulate matter from the air. Trees shade pavement and reduce air temperatures and the urban heat island.

In addition to what we traditionally think of as the benefits of trees, recent studies have also shown a positive correlation between trees and social benefits and quality of life indicators, including the reduction of reports of physical violence in public housing that had trees outside the buildings and significantly better relations and stronger ties between neighbors (Kuo and Sullivan, University of Illinois). Research also shows that consumers are willing to shop longer and spend more in retail areas that have trees because trees provide a “human habitat” (Wolf, University of Washington).

With all the known benefits of trees, why is our urban tree canopy in critical condition? There is not a simple answer. A healthy urban forest has many challenges. Active attention is needed by several segments of the community to reverse the decline. The Street Tree Master Plan focuses on policies and practices that result in reduction to the tree canopy and then sets the course to reverse the trend. The Plan establishes policy direction to begin management of Miami-Dade County’s urban tree resources as a necessary priority. The Plan calls attention to the green infrastructure to address the concerns of trees along our streets and highways. The Plan describes the procedures for planting and maintenance of street trees throughout Miami-Dade County and encourages partnerships with municipalities for the countywide implementation of the Plan for a greener, more livable community.

The mission of the Miami-Dade County Street Tree Master Plan is to provide the framework to design and implement street tree plantings that complement the purpose and intent of the

Landscape and Tree Ordinances and to be used as minimum standards in order to enhance the County tree canopy to a minimum of 30 percent coverage, countywide by 2020.

Goals of the Street Tree Master Plan

- ✿ Plant quality trees in public rights of way
- ✿ Develop and execute a Tree Management Plan to craft sustainable tree structure
- ✿ Promote the design of urban spaces that adequately fit trees
- ✿ Encourage local growers to produce the quality and species for public rights-of-way
- ✿ Educate policy makers and the public on the importance of adequate tree canopy
- ✿ Promote the expansion of the overall canopy in Miami-Dade County to at least 30 percent by 2020. This target reflects both the initiatives of the Street Tree Master Plan and other canopy restoration efforts in Miami-Dade County to create a greener, more walkable, livable community.

The Street Tree Master Plan will accomplish the “greenprint” goals by:

- ✿ establishing a street tree working group
- ✿ educating Miami-Dade citizens on tree canopy issues
- ✿ promoting “right tree, right place”
- ✿ inventorying the condition of Miami-Dade street trees
- ✿ researching historical habitat and ecology
- ✿ developing guidelines for maintenance of the green infrastructure on par with the gray infrastructure

Healthy street trees play an integral role in supporting the County’s urban shade “canopy,” which contribute greatly to lower ambient air temperatures, increase aesthetic enjoyment, provide economic improvement, improve the quality of life, and enhance the historic characteristics of our community. A shady, tree-lined street is more walkable, especially in the summer months in South Florida.

The Street Tree Master Plan is guided by an overall vision to restore and enhance the County's tree canopy into a thriving urban forest that provides multiple aesthetic and environmental benefits. The Miami-Dade County Street Tree Master Plan, the Miami-Dade County Landscape Manual, and the proposed Best Management Practices are designed to support the vision by providing a “greenprint” for the appropriate planning, implementation, and management of our existing and planned tree resources.

A Greenprint for Our Future

Introduction

The urban forest is stressed in many cities around the country, but in Miami-Dade County our urban trees are in critical condition. A number of factors have contributed to the diminished tree cover in Miami-Dade, but the problem became even more significant after the tree destruction by the 2005 hurricanes, Katrina, Rita, and Wilma. Hurricanes and windstorms do not account for the entire deficit in tree cover. Further causes include development activities, increased impervious areas, and the removal of trees due to citrus canker.

Adequate tree canopy is vital to the environmental and economic well being of our community. Trees **save money on our electric bills** by shading homes, offices, and streets, resulting in a reduced need for the use of air conditioning. Trees **reduce storm water runoff** by intercepting rainfall through their leaves and branches and releasing it slowly and also actively removing water from the soil. National studies indicate that **trees increase property values** by 5-15 percent and make communities more visually and environmentally appealing. Trees **improve air quality** by absorbing pollutants and particulate matter from the air. Trees shade pavement and **reduce air temperatures**.

In addition to what we traditionally think of as the benefits of trees, recent studies have also shown a positive correlation between trees and social benefits and quality of life indicators, including the reduction of reports of physical violence and significantly better relations and stronger ties between neighbors in public housing that had trees outside the buildings (Kuo and Sullivan, University of Illinois). Research also shows that consumers are willing to shop longer and spend more in retail areas that are have trees because trees provide a “human habitat” (Wolf, University of Washington)

Additional tree benefits:

- ✓ **Contribute to the processes of air purification, oxygen regeneration, and ground water recharge.**
- ✓ **Aid in the abatement of noise, glare, heat, air pollution and dust generated by major roadways and intense use areas.**
- ✓ **Protect and buffer the effects of high winds on structures, i.e. “wind break”.**
- ✓ **Reduce local air temperatures and the urban heat island effect, where temperatures in cities are higher than surrounding suburban and rural areas due to paved and dark surfaces that absorb and store energy.**
- ✓ **Improve the aesthetic appearance of commercial, industrial, and residential development and complement urban redevelopment by protecting and increasing property values within the community.**
- ✓ **Promote physical and emotional well being by providing a connection with nature.**
- ✓ **Calm traffic when planted in traffic circles, bulb-outs and medians**
- ✓ **Make neighborhoods more livable.**
- ✓ **Promote public health and well-being by improving the pedestrian environment by providing shade and creating a setting conducive to walking and non-motorized transportation.**
- ✓ **Establish community identity, character and linkages.**

Tree Canopy in Miami-Dade County

Background

With all the positive benefits, one would assume that tree canopy would be a priority for Miami-Dade County. A 1996 analysis by the non-profit organization American Forests, in partnership with Miami-Dade County, determined that the tree canopy cover in unincorporated Miami-Dade County averaged only about 10 percent with some municipalities showing as little as one to two percent tree coverage. The average metropolitan area in the United States has a tree canopy of 33.4 percent. Optimal urban canopy coverage is considered to be 40-45 percent. In addition, the existing canopy consists of a high percentage of non-native invasive species and inferior quality trees, some of which threaten natural areas or are hazards in windstorms. There is a disconnect between knowing that adequate tree canopy is essential for the livability of our community and the number of the public policies that are currently in place. It is important to note that seven municipalities have taken the lead with their tree policies and earned Tree City USA recognition: Aventura, Coral Gables, Miami, Miami Gardens, Miami Springs, North Miami, and North Miami Beach.

When gray infrastructure wins over green

Historically, the green infrastructure in our community has taken a back seat to the gray infrastructure (roads, buildings, impervious surfaces). The increase in frequency of hurricanes throughout Florida in recent years has brought the issue of public tree policies to the forefront. There are many excellent resources for tree education in South Florida; however the consistent application of state-of-the art urban tree planting and management techniques lags behind the science. We know that not all trees are good trees for South Florida. We also know that many quality trees have been planted in the wrong places and they have been pruned improperly. After the storms of 2005, a Tree Summit was held to discuss what led to tree failures: not enough root space, inferior quality trees, and improper maintenance and pruning were the main

culprits. A Category 5 storm will bring massive tree destruction; however the damage from smaller hurricanes can be reduced by implementing comprehensive tree health policies and thereby returning the usability of roadways much quicker after a storm. Bringing the policies to meet the science is essential to mitigate damage from storms, but also to establish adequate tree coverage to enhance the quality of life in Miami-Dade County.

The Street Tree Master Plan establishes policy direction to begin management of Miami-Dade County's urban tree resources as a necessary priority. It manages the green infrastructure to address the concerns of trees along our streets and highways and to provide a reference for urban street tree resources. The Plan describes the procedures for planting and maintenance of street trees throughout Miami-Dade County and encourages partnerships with municipalities for the countywide implementation of the Plan for a greener, more livable community.

Healthy street trees play an integral role in supporting the County's urban shade "canopy," which: contributes greatly to lower ambient air temperatures, increases aesthetic enjoyment, provides economic

improvement, improves quality of life, and enhances the historic characteristics of our community. A shady, tree-lined street is more walkable, especially in the summer months in South Florida.

The Plan is guided by an overall vision to restore and enhance the County's tree canopy into a thriving urban forest that provides multiple aesthetic and environmental benefits. The Miami-Dade County Street Tree Master Plan, the Miami-Dade County Landscape Manual, and the proposed Best Management Practices are designed to support the vision by providing a "greenprint" for the appropriate planning, implementation, and management of our existing and planned tree resources. The Plan complements the efforts of other County agencies to green our community. These efforts include the Open Space Master Plan by the Park and Recreation Department and the Miami-Dade County Typical Section and Zoned Right-of-Way Update Study funded by Metropolitan Planning Organization and coordinated by the Planning and Zoning Department.

MISSION

The mission of the Miami-Dade County Street Tree Master Plan is to provide the framework to design and implement street tree plantings that complement the purpose and intent of the Landscape Ordinance and to be used as minimum standards in order to enhance the County tree canopy to a minimum of 30 percent coverage, countywide by 2020.

Goals of the Street Tree Master Plan

- ✿ Plant quality trees in public rights of way
- ✿ Educate policy makers and the public on the importance of adequate tree canopy
- ✿ Promote the design of urban spaces that adequately fit trees
- ✿ Develop and execute a tree management plan to craft sustainable tree structure
- ✿ Encourage local growers to produce the quality and species for public rights-of-way
- ✿ Promote the expansion of the overall canopy in Miami-Dade County to at least 30 percent by 2020. This target reflects both the initiatives of the Street Tree Master Plan and other canopy restoration efforts in Miami-Dade County to make a more walkable, livable community.

Urban Tree Challenges

✿ **Improper pruning, lack of maintenance:** The lack of maintenance or improper maintenance including pruning, fertilization, mulching, and replacement of trees that have died, become a hazard, or are in a state of decline. Topping and excessive pruning practices such as "hatracking" or "lion-tailing" lead to mortality in urban trees. "Hat-racking" is illegal in Miami-Dade County under the landscape and tree code. Contrary to popular belief, "Hatracking" actually makes a tree more hazardous in high winds by replacing strong limbs with weak ones that will break off in subsequent years. Many trees are pruned by yard services and maintenance contractors without the proper training or arborist certification. Misconceptions about correct pruning methods and frequency of pruning have created a need for educating both the public and landscaping businesses. The information is available on the web (<http://hort.ifas.ufl.edu/woody/pruning>), in books, pamphlets produced by the Cooperative Extension office and the International Society of Arboriculture, and at education programs but many people do not avail themselves to this information.

*Bad Practice:
Hatracked Tree*

✿ **Planting the wrong tree in the wrong place:** Urban areas frequently have limited space for roots and canopy due to power lines and other utilities, signs, water requirements, poor or sometimes excessive drainage, and paving. These conditions cause the stress that is most often the cause of tree mortality in commercial/industrial areas. Historically, fast-growing trees, trees with an inexpensive purchase price that were Florida Grade #2 or cull, which are inferior quality, also found their way into the public rights-of-way. Some of these street trees are messy (black olive) or have low wind tolerance (*Ficus benjamina*) which can erode public support for street trees. Even quality trees and native species need room and proper soil conditions to grow.

*Invasive exotic tree, too close to
building and power lines*

✿ **Hurricanes and other windstorms:** As the frequency and strength of hurricanes and windstorms have increased in Florida, the media and general public often focus on tree failures. Taking a closer look, there are lessons to be learned from previous hurricanes. It is difficult to educate the public on all the nuances of trees. The power outages, tree damage, and the time and costs of clean-up have many South Florida residents leery of trees. In fact, certain species of well-placed trees can actually serve as a wind block and protect property. Inferior quality trees, trees with overly dense canopies, trees that have been "hatracked" (hatracking is a big cause of overly dense canopy), can split or lose large limbs during strong winds. Prevention efforts such as species selection can impact the survivability of a tree. Furthermore, brittle or shallow rooted trees can blow over at low wind speeds. Trees that are professionally pruned fall less than unpruned trees. Increased reports of illegal tree removal or "hatracking" often follow storm events where tree "experts" damage the tree for future storms.

Shallow roots, too small space

✿ **Traffic Setbacks and Liability Concerns:** Often the setback requirements in the public rights-of-way are so restrictive that trees cannot be planted and limits the selection of tree species. Miami-Dade County is taking a hard look at sight distance triangles, traffic speed, pedestrian safety and other issues that may enhance opportunities for tree placement.

*Bad Practice:
Tree Grate Girdling Tree*

✿ **Poor Planting:** Improper planting, rough handling, girdling from staking, tree grates, and weed-eaters as well as planting poor quality trees are

other reasons for high mortality of urban trees.

✿ **Lack of water and post planting care:** Recently planted trees as well as older trees under drought stress need to be watered to prevent decline.

*Defective Roots:
Circling*

✿ **Root defects on nursery stock:** Roots that circle, girdle, kink, and other root defects in nursery stock doom a tree before it goes into the ground.

✿ **Chemicals:** Misuse of lawn treatment chemicals, herbicides and other chemicals that leach into the root zone or are absorbed through the bark, can adversely impact tree root systems, causing defoliation or general decline and death.

✿ **Inferior soil:** Extensive areas of compacted fill or road base soils and utility construction often are unsuitable for healthy root system growth and development. Likewise amending the soil solely around the root ball

may lead to circling roots rather than encouraging the roots to reach further out to establish a stable root system.

✿ **Construction Damage:** Mechanical damage from construction equipment, crushing of near surface roots from heavy machinery and practices such as trenching through roots and paving over the root zone will cause decline and often mortality in urban trees.

✿ **Bark Damage:** Young as well as old trees often fall victim to being girdled by lawnmowers and string trimmers. Tree straps and stakes not removed in a timely basis and car bumpers can damage the bark.

✿ **Vandalism:** Vandalism such as graffiti painting, damaging the bark by carving, nailing, stapling, and other physical abuses.

✿ **Confusing regulatory and maintenance environment and inconsistent tree policies between departments and outside agencies:** There are a number of tree planting and protection measures in place within the county and municipalities. How the regulations interface can be complicated to laypersons not familiar with tree species and tree science. The regulatory environment varies depending on location. In addition, who does tree planting and maintenance activities along a given roadway depends often on the size of the roadway and whether the governmental agencies have maintenance agreements in place with other agencies.

✿ **Air pollution:** Air pollution can affect trees by damaging foliage and impairing processes such as photosynthesis, thus impacting a tree's health and making it more susceptible to insect damage and disease.

✿ **Invasive, non-native species:** Invasive, non-native species cause environmental damage by invading native plant communities and disrupting natural processes. Many landscape plants are not a problem for our natural resources. However, a few are so invasive that they have completely overrun natural forests and crowded out rare and unique plants found nowhere else in the world. It is costly to the County to protect our natural areas from these invasive pest plants. Residents and businesses can help by avoiding plants that are known to be invasive. Prohibited plant species are listed in the November 1999 Comprehensive Development Master Plan (CDMP), as amended which are demonstrably detrimental to native plants, native wildlife, ecosystems, or human health, safety, and welfare.

*Invasive Exotic
Melaleuca Tree*

Meeting the Goals of the Miami-Dade County Street Tree Master Plan

The Street Tree Master Plan was developed by an ad-hoc working group. It is recommended that a permanent street tree working group be established as a committee of the Community Image Advisory Board (CIAB) with representation from the Office of Community Image, the Department of Environmental Resources Management (DERM), Public Works Department, Planning and Zoning, Consumer Services (Cooperative Extension), Office of Strategic Business Management, Park and Recreation, Team Metro, Office of Emergency Management (OEM), and the Metropolitan Planning Organization, and the seven municipalities who have achieved "Tree City USA" designation, with Florida Power and Light (FPL) and local nursery growers. This street tree working group will be responsible for the implementation, monitoring, and maintenance activities described in the Master Plan. Over time, as advances in tree science and intergovernmental cooperation progresses during implementation, the tree species list in Appendix A, the contact information in Appendix C, and the task list in Appendix D may require revisions. These changes will be reviewed and amended as necessary by the CIAB and reported to the BCC during the annual report.

Maintenance of existing and newly planted street trees are essential activities that protect State, County, and municipal investments and lessen the cost of liability, while ensuring that the street tree population thrives and achieves desired aesthetic and environmental functions.

However, like most maintenance activities, an on-going commitment of resources is needed to maintain the green infrastructure. Preventative pruning for windstorm resistance, structural pruning, and tree fertilization extend the life expectancy of street tree investments.

How can we improve our street tree practices?

Planning

- Provide a baseline study to determine the current state of the urban tree canopy and update the information as trees are planted and removed with a canopy analysis every 10 years to measure progress towards the canopy goal and place utilities away from trees.
- Inventory Conditions of Miami-Dade Street Trees. The Public Works Department will expand the County's present inventory of street tree plantings from 1992-2006 to include information such as "treatment required" (removal, structural pruning, raising, reduction, cleaning, fertilizing, sidewalk repair, estimate of time required for this treatment), size, date planted, species and condition/structure of trees, empty spaces where trees can be planted, size of space. This database will continue to be refined and updated with the use of GIS tools and shall incorporate all existing street trees. In the future, it is envisioned that the GIS database will be able to assist planners in expanding the biodiversity of the urban forest in planning design activities.
- Expand the Role of the County Landscape Committee. The County Landscape Committee is appointed by the County Manager and currently reviews right-of-way plantings on County maintained roadways and coordinates the Joint Participation Agreements with the Florida Department of Transportation. It is recommended that the Manager expand the role of the County Landscape Committee to oversee the status of the urban tree canopy and provide a forum for departmental input in the implementation of the Street Tree Master Plan. As mentioned earlier, multiple departments are involved in street tree issues within

Miami-Dade County. The Landscape Committee will coordinate cross departmental activities and work with BCC members to identify areas of critical concern for lack of tree canopy.

- Coordinate and expand on the success of the Adopt-a-Tree Program goals:
 - ✓ Reforest Miami-Dade County
 - ✓ Educate the public on the significance of urban tree canopy in flood protection, erosion control, energy use, air quality, community aesthetics, and a cost benefit analysis.
 - ✓ Teach the public how to properly plant and care for trees, especially when pruning.
 - ✓ Coordinate with Miami-Dade County municipalities to implement program activities within their municipal boundaries.
 - ✓ Implement a multilingual educational component addressing appropriate placement, planting procedure and long-term maintenance of the restored canopy.
 - ✓ Utilize plant material from local nurseries whenever possible so that it is locally adapted.
 - ✓ Improve the locally available tree stock by teaching the nurseries to grow high-quality new species.
 - ✓ Reinforce and expand upon partnerships with local environmental, educational, and community groups.
 - ✓ Seek additional matching funds and sponsorships to expand program efforts.
 - ✓ Limit the administrative costs associated with the program.
- Miami-Dade County will encourage dialogue and involvement of residents, municipalities, home owners associations, property owners, as well as coordination between all parties involved in street tree design and management.
- Coordinate activities with the Community Image Advisory Board to enhance landscaping on selected corridors and entryways in Miami-Dade County.
- Link urban and suburban environments with parks and natural areas. Identify and support a network of connectivity, through street planting, that complements greenway and blueway (paddling trail for non-motorized watercraft e.g. canoe or kayak) planning and implementation.
- Use street trees as a traffic calming device to support safe sidewalks and street crossings for school children and pedestrians in general.
- Encourage urban planning efforts to include the design of pedestrian friendly environments. Encourage provisions of wide sidewalks with sufficient space for trees where appropriate, in public design projects. Design the soil space under and adjacent to the hardscape to sustain root growth – good trees well connected to the ground only develop if the roots have room to grow.
- Work with study group for the Miami-Dade County Typical Section and Zoned Right-of-Way Update Study.
- Map and prioritize removal of hazardous street trees and replant where appropriate and develop a program for the selective replacement of undesirable species that may be brittle, invasive or not appropriate for rights-of-way plantings due to fruit drop or invasive roots. Tree replacement would focus on less problematic species listed in the Street Tree Master Plan.
- Prevent the destruction of the community's existing street tree canopy and specimen sized-trees and protect designated historic landscapes and tree resources.
- Emphasize the use of hardwood shade trees for canopy restoration while using palms as accent plants in public plantings. While palms are aesthetically pleasing and look “tropical,” they do not provide the same environmental benefits, walkable streets, or lower ambient temperatures as hardwood shade trees.

Planting

- Plantings will be coordinated with other departments and agencies such as Florida Department of Transportation (FDOT), utility companies; the Miami-Dade Public Works and Water and Sewer (WASD) Departments, and municipalities in order to avoid project conflicts with tree installations.
- Identify and plant in areas that have low canopy coverage. Encourage planting on private property in the form of setback plantings, which contribute to the streetscape.
- Develop a cost-share program whereby a resident can select and purchase trees and have the County or a designated private contractor buy, plant, and stake the trees for the resident on the public right-of-way. As a part of this program, the resident would agree to assume the maintenance responsibility for the trees.
- Improve the street tree inventory by planting trees that are wind tolerant species in the public right-of-way and protect existing inventory by proper maintenance trimming. By improving the survivability of street trees during wind storms, the public investment is protected but also will reduce road debris and hasten power restoration after a storm event.
- Provide a list of recommended street trees (See Appendix A) to give guidance to citizens and governmental agencies regarding which tree species survive better in harsh conditions for street trees, especially in swale areas. Median trees may offer more flexibility of species depending on the size of the planting area.
- Plant street trees that minimally meet Florida Grades and Standards Grade #1 standards (Chapter 18A-6 (k) of the Code of Miami-Dade County, Florida) and execute a pruning program to encourage structural pruning to develop sustainable structure less sensitive to wind damage.
- Increase biodiversity through the appropriate use of native tree species in the landscape.
- Coordinate the tree planting, permitting, removal and enforcement of all municipalities and County agencies and promote countywide cooperation in the restoration of canopy within Miami-Dade County.

*Bad Practice:
Lions tailing, shaping*

Pruning

- Institute a structural pruning program on a 3-year pruning cycle to maintain the existing inventory as well as new plantings to ensure long-term sustainability. Trees that had been over lifted, lions tailed, shaped, and/or lacked structural pruning were the cases of many tree failures during the 2005 hurricanes.
- Explore the creation of a training and regulatory program for tree pruning operations.

Education and Growth

- Educate the public, local decision-makers and agency staff on the importance of the urban tree canopy and tree canopy enhancement education in the schools.
- Establish stewardship of the existing legacy of mature trees and effective planning for future planting and maintenance needs.
- Promote the use of trees for energy conservation by encouraging cooling through the provision of shade and the channeling of breezes, thereby helping to offset global

warming and local heat island effects through the added absorption of carbon dioxide and reduction of heat islands.

- Emphasize the use of native trees in place of invasive or non-native species to reduce the negative impacts of these species to native plant communities. Encourage local growers to produce the trees the species and quality for public plantings.
- Promote the concept of building sites to sustain the right tree, planting the right tree or plant in the right place to avoid damage to infrastructure such as clogged sewers, cracked sidewalks, and power service interruptions.
- Establish seed or vegetative sources for contract growing of rare and endangered species and use native species listed as “threatened” or “endangered” where feasible and appropriate.
- Encourage re-establishment, restoration, and replanting of historic ecological community associates and geographic conditions with the original native species (hardwood hammocks, pine rocklands etc.) where feasible or appropriate for current conditions.

- Research Historical Habitat and Ecology. Research of historical conditions should be accomplished by using appropriate maps, surveys, and accounts to document what vegetation originally existed in sites to be planted. The historical physical conditions of the site (including geomorphology, topography, soils, hydrology, and vegetation) should be researched to compare historical and current conditions in order to determine whether restoration/re-creation of historic plant communities is appropriate. In many cases, existing conditions may not support historical plant species due to alterations of soil and hydrological conditions during construction of the right-of-way, however, in other cases, plant species that existed in certain geographic areas fare better when planted in the same geographical area. An example would be coastal species that thrive with high salinity conditions or mahogany trees, while natives do better and are less brittle in far south Miami-Dade County. Bringing back native species into their historical conditions can also save time and money in maintenance activities.
- Develop Guidelines for Rare, Threatened or Endangered Tree Species. After determining the historical conditions of a given site and opportunities, constraints for restoration, locations and sources of seeds/vegetative material need to be identified within the historical growth range of the species. Propagation material should be collected without damaging the existing seed/vegetative material on site. All permits and permissions should be secured and locations and seed sources kept separate and documented. Propagation and experimental growth methodologies need to be developed for many of these species. Because many of these species are difficult to grow, contract growing should begin upon completion of the preceding tasks.

- Explore “Tree City USA” designation for Miami-Dade County from the National Arbor Day Foundation. To qualify, the County must meet four standards: pass an Arbor Day Observance proclamation, enforce tree protection ordinances, appoint a tree committee, and contribute \$2.00 per capita of its annual revenue to tree care and planting. The feasibility of countywide implementation or implementation in the Unincorporated Municipal Service Area (UMSA) would be explored by the County Working Group. Currently the municipalities of Aventura, Coral Gables, Miami, Miami Gardens, Miami Springs, North Miami, and North Miami Beach are designated Tree City USA cities.

- Explore establishment of a Green Utility. One possible funding source for the greening of Miami-Dade County is to establish a green utility fee. The Florida Legislature (FL Statutes, 259.035) authorized local governments with populations exceeding 500,000 to collect fees through a voluntary check-off on a utility bill to be determined for the purpose of planting and maintaining the public trees, management of public natural areas, and to fund other tree related programs.

Greenprint for our Future

The successful implementation of the Street Tree Master Plan and compliance with the Landscape Ordinance require the involvement of residents, business owners, government officials, construction contractors, engineers, developers, landscape architects, landscape maintenance companies and employees, neighborhood associations, community planners, and tree care service contractors and employees - in other words, all of us.

Miami-Dade County is developing a *Miami-Dade County Guide to Tree Planting and Maintenance in the Public Right-of-Way* to provide citizens with detailed information about the selection, placement, planting, and care of our tree resources. Understanding the challenges and opportunities of trees in South Florida is key to restoring and maintaining a healthy, livable, walkable community.

During the development of this Plan, many positive changes have already occurred through the identification of bad tree practices and the communication between organizations with similar goals. We have a long way to go. Many current practices in the community at-large are bad for trees and the development of adequate canopy. The wrong trees have been planted in the wrong places. Trees have been hatracked, lion tailed, shaped into topiaries, weakening the tree structure and creating possible hazards. After the 2005 hurricanes, media reports of tree damage to homes and property fueled the myth that trees are a hazard in storms, when in fact, the right tree in the right location can serve as a wind break and lessen structural damage to buildings by taking the brunt of the wind force. Retailers have removed trees so their signs can be seen better, but ignoring data on improved retail sales in canopied areas. In some cases, we plant trees and then don't adequately fund the on-going maintenance.

There is a bounty of tree information on the web, in books, seminars, and through government programs such as Adopt-a-Tree. However, in addition to existing programs, a coordinated education and outreach campaign is needed to make sure that the information interpreted for the climate and conditions of South Florida and it is in the hands of those who need it. We need to dispel tree myths in Miami-Dade County and have public policies that match the science. It's the Greenprint for Our Future.

Recommended Street Tree Species *

Common Name	Scientific Name	Height Range	Tree Size	Tree Type	Growth Rate	Blooming Season	Special Needs/ Comments
Allspice	<i>Pimenta dioica</i>	15' - 30'	Medium	Shade	Slow	N/A	Leaves are leathery, aromatic and quite attractive. Has whitish gray bark peels in thin sheets. The leaves and fruit smell like a combination of cloves, black pepper, nutmeg, and cinnamon, hence the common name. Small white flowers. Wind tolerant.
Bahama Lysiloma	<i>Lysiloma sabicu</i>	20' - 30'	Medium	Shade	Slow	N/A	Slow growing shade tree with small leaves and red-dish new growth. Can be invasive, so do not plant next to a natural area
Bald Cypress	<i>Taxodium distichum</i>	30' - 60'	Large	Native	Moderate	N/A	Thrives in wet sites. Native deciduous tree. Loses all its leaves in winter. Wind tolerant.
Bitterbush	<i>Picramnia pentandra</i>	12' - 18'	Small	Native	Moderate	N/A	Can be planted adjacent to power lines.
Black Ironwood	<i>Krugiodendron ferreum</i>	20' - 30'	Small	Native	Slow	N/A	Wind tolerant.
Black torch	<i>Erithalis fruticosa</i>	10' - 20'	Small	Native	Fast	N/A	Can be planted adjacent to power lines.
Blolly	<i>Guapira discolor</i>	25' - 35'	Medium	Native	Moderate	N/A	Hardy shade tree. Needs minimal care. Very salt tolerant.

Common Name	Scientific Name	Height Range	Tree Size	Tree Type	Growth Rate	Blooming Season	Special Needs/ Comments
Brown Ebony	<i>Caesalpinia punctata</i>	20' - 30'	Medium	Flowering	Moderate	Summer	Beautiful, wide spreading tree up to about 15 m tall (50 ft) and 23 m spread (75 ft); yellowish to tan-colored trunk, dividing into several large branches low on stem; flowers small and light yellow. Ornamental specimen tree.
Colville's Glory	<i>Colvillea racemosa</i>	40' - 50'	Large	Flowering	Moderate	Fall (November)	Clusters of vivid scarlet and orange flowers. Like a late season flamboyant.
Copperpod	<i>Peltophorum pterocarpum</i>	40' - 50'	Large	Flowering	Fast	Spring/ Summer	Fast-growing evergreen tree. Produces fragrant, showy yellow flowers in the spring and summer. Seedpods turn to an attractive wine-brown color. Subject to wind damage. Needs space to develop adequate root system to reduce the likelihood of toppling
Crape Myrtle	<i>Lagerstromia indica</i>	15' - 20'	Small	Flowering	Moderate	Summer (May-September)	Lavender or white flowers. Can be planted adjacent to power lines
Dahoon Holly	<i>Ilex cassine</i>	20' - 40'	Large	Native	Moderate	N/A	Wet areas; wind tolerant

Recommended Street Tree Species *

Common Name	Scientific Name	Height Range	Tree Size	Tree Type	Growth Rate	Blooming Season	Special Needs/ Comments
Desert Senna	<i>Senna polyphylla</i>	10'- 15'	Small	Flowering	Slow	Fall	Slow growing evergreen tree with a spreading, cascading crown with tiny leaves. Produces yellow flowers throughout Fall to Spring. Larval plant for Sulfur butterfly. Can be planted under power lines, but planting as a standard can result in a snapped main stem.
Florida Privet	<i>Forestiera segregata</i>	10'- 15'	Small	Native	Moderate	N/A	Drought tolerant; OK under power lines
Geiger Tree	<i>Cordia sebestena</i>	20' - 25'	Small	Flowering Native	Moderate	Year-round	Moderate-growing with a dense rounded evergreen canopy. Flowers appear throughout the year with small edible white pear-shaped fruit. Salt and wind tolerant.
Green Buttonwood	<i>Conocarpus erectus</i>	30' - 50'	Large	Native	Moderate	N/A	Salt and Wind Tolerant
Guinea plum	<i>Drypetes laterifolia</i>	20' - 30'	Small	Native	Slow	N/A	
Gumbo limbo	<i>Bursera simaruba</i>	40' - 50'	Large	Native	Fast	N/A	Does not have showy flowers, but it is affectionately called the tourist tree because of its shiny red and peeling bark. Wind tolerant.
Inkwood	<i>Exothea paniculata</i>	25' - 35'	Medium	Native	Moderate	Summer	Slender dense crown with glossy leaves and tiny fragrant blooms in spring and early summer. Produces red berries that ripen to deep purple. Native

Common Name	Scientific Name	Height Range	Tree Size	Tree Type	Growth Rate	Blooming Season	Special Needs/ Comments
Jacaranda	<i>Jacaranda mimosifolia</i>	40' - 50'	Large	Flowering	Fast	Fall and Winter (if cool enough)	Needs space to develop adequate root system to reduce the likelihood of toppling. Does not flower well in South Florida.
Jamaica Rain	<i>Brya ebenus</i>	15' -30'-	Small	Flowering	Slow	Spring and Summer	Blooms spring, summer and in times of high humidity. Tolerates heat and salt but may drop leaves when dry Excellent street tree selection.
Japanese Fern	<i>Filicium decipiens</i>	20'- 30'	Medium	Shade	Moderate	N/A	Broad canopy. Decorative leaves.
Krug's Holly	<i>Ilex krugiana</i>	25' - 30'	Small	Native	Moderate	N/A	Attractive red berries in winter.
Lancepod	<i>Lonchocarpus violaceous</i>	30' - 35'	Medium	Flowering	Fast	Late Summer/Fall	Evergreen with a fast-growing, dense canopy. Produces fragrant, lavender, showy flowers during the late summer/fall. Produces long, slender, seed pods. Plant at least 30 feet from power lines and 16-22 feet from your house. Full sun.
Lancewood	<i>Nectandra coriacea</i>	25' - 35'	Medium	Native	Moderate	N/A	Aromatic leaves and small clustering white flowers. Attract bees. Wind tolerant.

Recommended Street Tree Species *

Common Name	Scientific Name	Height Range	Tree Size	Tree Type	Growth Rate	Blooming Season	Special Needs/ Comments
Lignum Vitae	<i>Guaicum sanctum</i>	10' - 30'	Small	Flowering Native	Very Slow	Year-round	Purple blooms several times per year. Slow-growing but long-lived, it is adaptable to dry rocky areas in full sun to light shade. Can be planted adjacent to Power Lines. Rare, expensive, but worth it in small spaces.
Limber Capper	<i>Capparis flexuosa</i>	15' - 20'	Small	Flowering Native	Moderate	Late Spring/ Summer	Pink and white flowers. Can be planted in partial sun adjacent to power lines.
Live Oak	<i>Quercus virginiana</i>	40' - 50'	Large	Native	Moderate	N/A	Wind tolerant.
Madagascar Olive	<i>Noronhia emarginata</i>	20' - 30'	Small	Shade	Moderate	N/A	Salt tolerant. Can be planted adjacent to power lines.
Mahogany	<i>Swietenia mahagoni</i>	35' - 60'	Large	Native	Fast	N/A	Low wind tolerance; needs space to develop adequate root system to reduce the likelihood of toppling; brittle in Central and North Dade
Mast Tree	<i>Polyalthia longifolia</i>	10' - 25'	Small	Shade	Slow	N/A	Narrow canopy tree with attractive foliage. Good for screening.
Mexican Cassia	<i>Caesalpinia mexicana</i>	20' - 25'	Small	Flowering	Moderate	Summer (May-September)	Fragrant, golden flowers. Needs full sun. Can be planted adjacent to power lines.

***Notes:**

- **These tree species do not rule out other species in public rights-of-way, but are meant to provide guidance based on historical performance of certain trees in the harsh and restricted street planting environment.**
- **The Street Tree Master Plan encourages the enhancement of countywide canopy by the planting of hardwood shade trees. As such, palm tree plantings can be researched through the contacts provided in Appendix C.**
- **Check with the municipal permitting agency for additional guidance in your municipality (Appendix C).**

Prohibited Tree Species

Trees that are prohibited to be planted, sold or propagated in Miami-Dade County:

Common Name:

Australian Pine

Banyon Fig

Brazilian Pepper

Bishopwood

Carrotwood

Castorbean

Catclaw Mimosa

Earleaf Acacia

Governor's Plum

Indian Dalbergia (sissoo)

Laurel Fig

Lead Tree

Lofty Fig Tree

Mahoe

Melaleuca (cajeput or paperbark tree)

Red Sandalwood

Seaside Mahoe

Queensland Umbrella Tree

Woman's Tongue

Botanical Name:

Casuarina spp.

Ficus bengalensis

Schinus terebinthifolius

Bischofia javanica

Cupaniopsis anacardioides

Ricinus communis

Mimosa pigra

Acacia auriculaeformis

Flacourtia indica

Dalbergia sissoo

Ficus microcarpa

Ficus nitida

F. retusa var. *varnitida*

Leucaena leucocephala

Ficus altissima

Hibiscus tiliaceus

Melaleuca quinquenervia

Adenantha pavonina

Thespesia populnea

Schefflera actinophylla

Albizia lebbek

TREE WORKING GROUP TASKS ASSIGNMENTS

TASK	ASSIGNED TO
Aggressively pursue funding opportunities with State, Federal, and private entities to replace lost canopy, develop adequate maintenance plans, and mitigation strategies	Strategic Business Management, Community Image Advisory Board, Office of Emergency Management, Public Works, Parks, municipalities, FPL
Develop an inventory of street tree resources in the County and develop a management plan for those resources	Public Works, DERM, Planning and Zoning, Cooperative Extension, Florida Division of Forestry, municipalities
Review County policies, procedures, and practices that may inhibit the implementation of the Street Tree Master Plan and the County Landscape Ordinance, including right-of-way regulations and determine the most effective management of the County Green Infrastructure. Explore Context Sensitive Solutions	Community Image Advisory Board, Planning and Zoning, Park and Recreation, Cooperative Extension, Team Metro, and Public Works
Review the existing inventory, tree pruning and species selection policies vis-à-vis wind storm and hurricane resistance to minimize property damage and tree loss during storm events. Seek mitigation strategies to address tree damage issues	Office of Emergency Management, Public Works, Cooperative Extension, and FPL
Institute partnerships with municipal agencies with responsibility for street tree planting and maintenance to establish intergovernmental efforts with regard to tree canopy restoration and enhancement	Community Image Advisory Board
Evaluate and strengthen as necessary the guidelines for plan review that ensure adequate protection of existing trees during construction, including, but not limited to, installation of barriers to prohibit any disturbance within the drip lines of existing trees	DERM, Public Works, FDOT, MDX, and municipalities
Oversee the training of County tree and landscape maintenance crews and County contractors. Improper trimming or damage by landscape tools may cause permanent harm to tree structure and create a hazardous tree	Consumer Services/Cooperative Extension, Public Works, and the Office of Emergency Management
Develop design criteria to be used in the site plan review process that will result in additional planting and landscaping opportunities, i.e. encourage bigger parking lot islands.	Planning and Zoning, municipalities
Coordinate with natural area managers to ensure that all right-of-way planting activities adjacent to natural areas or preserves are species appropriate to that habitat and existing prohibited species are removed from the area at time of the planting	DERM, Park and Recreation, Public Works and municipalities
Encourage site analysis so that if soil is compacted or rocky or water is within 2 feet of the surface then large maturing trees are not planted, or the site is modified	Public Works, municipalities
Develop a plan and oversee the removal of prohibited species from the public right-of-way and replacement with appropriate species	DERM, Public Works, Parks
Conduct public meetings with homeowner groups and other stakeholders to reach a consensus about how the road corridors should look	Public Works and Planning and Zoning
Serve as liaison to community based organizations working with tree planting initiatives	DERM and Community Image Advisory Board
Develop a cost-share plan with other governmental entities, the private sector, and residents for a tree-planting program the rights-of-way	Street Tree Working Group

Create and update Miami-Dade County Guide to Tree Planting and Maintenance in the Public Right-of-Way as needed	Community Image Advisory Board, Public Works, Planning and Zoning
Provide annual reports to the Board of County Commissioners on the State of the Urban Tree Canopy beginning in 2008 which detail the baseline study information and planting activities related to the Street Tree Master Plan	Community Image Advisory Board and Street Tree Working Group
Improve the street tree inventory by planting trees that are wind tolerant species in the public right-of-way and protect existing inventory by proper maintenance trimming. By improving the survivability of street trees during wind storms, the public investment is protected but also will reduce road debris and hasten power restoration after a storm event	Public Works and municipalities
Establish stewardship of the existing legacy of mature trees and effective planning for future planting and maintenance needs	Street Tree Working Group
Provide a list of recommended street trees as per the Landscape Ordinance (See Appendix A) to give guidance to citizens and governmental agencies regarding which tree species survive better in harsh conditions for street trees, especially in swale areas. Median trees may offer more flexibility on species depending on the size of the planting area. Review annually to update information	Planning and Zoning
Promote the use of trees for energy conservation by encouraging cooling through the provision of shade and the channeling of breezes, thereby helping to offset global warming and local heat island effects through the added absorption of carbon dioxide and reduction of heat islands	DERM
Map and prioritize removal of hazardous street trees and replant where appropriate and develop a program for the selective replacement of undesirable species that may be brittle, invasive or not appropriate for rights-of-way plantings due to fruit drop or invasive roots. Tree replacement would focus on less problematic species listed in the Street Tree Master Plan	Public Works, municipalities
Encourage urban planning efforts to include the design of pedestrian friendly environments. Encourage provisions of wide sidewalks with sufficient space for trees where appropriate, in public design projects. Design the soil space under and adjacent to the hardscape to sustain root growth – good trees well connected to the ground only develop if the roots have room to grow	Planning and Zoning, Public Works, municipalities
Coordinate the tree planting, permitting, removal and enforcement of all municipalities and County agencies and promote countywide cooperation in the restoration of canopy within Miami-Dade County	Street Tree Working Group
Link urban and suburban environments with parks and natural areas. Identify and support a network of connectivity, through street planting, that complements greenway and blueway (paddling trail for non-motorized watercraft e.g. canoe or kayak) planning and implementation	Street Tree Working Group
Use street trees as a traffic calming device to support safe sidewalks and street crossings for school children and pedestrians in general	Public Works, municipalities
