OPIOID POISONINGS
A PUBLIC HEALTH CRISIS

Anthoni Llau, PhD
Epidemiologist, Florida Department of Health in Miami-Dade County
Office of Epidemiology, Disease Control, and Immunization Services
WHAT ARE OPIOIDS

- Medications that relieve pain
- Reduce the intensity of pain signals reaching the brain and affect those brain areas controlling emotion, which diminishes the effects of a painful stimulus
- Hydrocodone – commonly prescribed for a variety of painful conditions, including dental and injury-related pain
- Morphine - often used before and after surgical procedures to alleviate severe pain.
- Codeine - often prescribed for mild pain
  - Can also be used to relieve coughs and severe diarrhea

OPIOID FACTS

• Street Names
  • Big H, Black Tar, Brown Sugar, Dover's Powder, Hillbilly Heroin, Horse, Junk, Lean or Purple Drank, MPTP (New Heroin), Mud, OC, Oxy, Oxytocoton, Paregoric, Sippin Syrup, Smack

• Forms
  • Tablets, capsules, skin patches, powder, chunks in varying colors (from white to shades of brown and black), liquid form for oral use and injection, syrups, suppositories, and lollipops

• Methods of abuse
  • Can be swallowed, smoked, sniffed, or injected.
OPIOID EFFECTS

- Effect on mind - Produces a general sense of well-being
  - Reduces tension, anxiety, and aggression
  - Helpful in a therapeutic setting but contribute to the drugs’ abuse
- Unwanted effects
  - Drowsiness, inability to concentrate, and apathy
  - Can create psychological dependence
  - Long after the physical need for the drug has passed, a person may continue to think and talk about using drugs and feel overwhelmed coping with daily activities
OPIOID EFFECTS

- Effect on body – Prescribed to treat pain, suppress cough, cure diarrhea, and put people to sleep
- Effects depend heavily on the dose, how it’s taken, and previous exposure to the drug
- Negative effects include: slowed physical activity, constriction of the pupils, flushing of the face and neck, constipation, nausea, vomiting, and slowed breathing
- As the dose is increased, both the pain relief and the harmful effects become more pronounced
- Physical dependence is a consequence of chronic opioid use, and withdrawal takes place when drug use is discontinued
  - Early withdrawal symptoms: watery eyes, runny nose, yawning, and sweating
  - As the withdrawal worsens, symptoms can include: restlessness, irritability, loss of appetite, nausea, tremors, drug craving, severe depression, vomiting, increased heart rate and blood pressure, and chills alternating with flushing and excessive sweating
  - Most withdrawal physical symptoms disappear within days or weeks, depending on the particular drug
OPIOID EFFECTS

- Overdose effects – Can be fatal
  - Respiratory failure – lack of sufficient oxygen in the blood
  - Vital organs like the heart and brain start to fail
  - Leads to unconsciousness, coma, death

- Physical signs of opioid overdose include:
  - Constricted (pinpoint) pupils, cold clammy skin, confusion, convulsions, extreme drowsiness, and slowed breathing
OPIOID MISUSE/ABUSE

On a daily basis 3,900 people initiate nonmedical use of prescription opioids*

- Amounts to 1.4 million persons/year

Reasons for increase in misuse/abuse
- Ease of access
  - Prescriptions for these medications have increased dramatically since the 1990’s
  - Misinformation pertaining to the addictive properties of opioids
  - Misconception that prescription drugs are less harmful than illicit drugs

1.9 million people reported prescription opioid abuse or dependence during 2013, whereas 517,000 reported heroin abuse or dependence (Florence et al. 2016)

* Survey on Drug Use and Health, 2014
Poisonings attributed to prescription drugs are the leading cause of injury-related mortality in United States.

Between 2000 & 2014, the rate of deaths from drug overdoses increased 137% (Rudd et al. 2016)

47,055 drug overdose deaths occurred in the United States during 2014

From 13.8 per 100,000 persons in 2013 to 14.7 per 100,000 persons in 2014 (6.5% increase)

A corresponding 200% increase in the rate of overdose deaths involving opioids (opioid pain relievers and heroin)

28,647 (61%) drug overdose deaths involved some type of opioid including heroin during 2014
ECONOMIC BURDEN

• Total economic burden estimate (FY - 2013) - $78.5 billion (Florence et al. 2016)

• Nearly two-thirds related to health care, substance abuse treatment, and lost productivity costs

• Fatal cases – approximately ¼ of total costs

• One-fourth borne by public sector in:
  • Health care costs
  • Substance abuse treatment costs
  • Criminal justice costs
RISK FACTORS

- Among those who died from prescription opioid overdose between 1999 and 2014:
  - Overdose rates highest among people aged 25 to 54 years
  - Overdose rates higher among non-Hispanic whites and American Indian or Alaskan Natives, compared to non-Hispanic blacks and Hispanics
  - Men were more likely to die from overdose, but the mortality gap between men and women is closing

B=Benzodiazepine, O=Opioid, S=Stimulant, M=Miscellaneous, rank refers to the current reporting period.

* Tramadol SA was moved from a legend prescription drug to a schedule IV controlled substance, August 2014.

Source: Florida Department of Health
Persons with dosages between 50 - 99 MMEs/day are at 3.7 times greater risk of an overdose event.

Persons with dosages over 99 MMEs/day are at 8.9 times greater risk of an overdose event.

Mean daily dosage/patient in morphine milligram equivalents and Percent of patients receiving a dosage > 100 MMEs, Florida Residents

Sources: Florida Department of Health & Centers for Disease Control & Prevention
HEROIN

- Opioid drug that is synthesized from morphine

- Usually appears as a white or brown powder or as a black sticky substance, known as “black tar heroin”

- Can be injected, inhaled (snorting or sniffing), or smoked
  - All three routes deliver the drug to the brain very rapidly, which contributes to its health risks and to its high risk for addiction

- Associated with a number of serious health conditions including fatal overdose, spontaneous abortion, and infectious diseases such as hepatitis and HIV
HEROIN DEATHS AND RISK FACTORS

Heroin Use Risk Factors

- Strongest Risk Factor - Past misuse of prescription opioids
  - Especially among people who became dependent upon or abused prescription opioids in the past year
- Non-Hispanic whites
- Males
- People addicted to marijuana and alcohol
- People addicted to cocaine
- Living in a large metropolitan area
- 18 to 25 year olds
HOSPITAL ADMISSIONS FOR OPIOID POISONING, BY SUBSTANCE, MIAMI-DADE COUNTY RESIDENTS, 2009 - 2015

Source: Florida Agency for Health Care Administration
FENTANYL

- Typically used to treat patients with severe pain or to manage pain after surgery

- Fentanyl associated with recent overdoses are produced in clandestine laboratories

- Fentanyl sold on the street can be mixed with heroin or cocaine
  - Powder form looks similar to heroin
    - 50 times more potent

- The high potency of fentanyl greatly increases risk of overdose
  - Especially if the person is unaware the drug contains fentanyl
Comparison of Drug Caused Deaths
2013 to 2015

Opioids

Source – Florida Medical Examiners Report
CARFENTANIL

- Synthetic opioid

- Used as a tranquilizing agent for elephants and other large mammals

- Can resemble powdered cocaine or heroin

- Approximately 10,000 times more potent than morphine
  - 100 times more potent than fentanyl
  - Fentanyl can be lethal at the 2-milligram range
Equivalent Strengths of Heroin, Fentanyl, and Carfentanil
OPIOID ABUSE PREVENTION

- Health care practitioners, communities and workplaces, patients, and families all can contribute to preventing prescription drug abuse
- Improve opioid prescribing to reduce exposure to opioids, prevent abuse, and stop addiction
- Expand access to evidence-based substance abuse treatment, such as Medication-Assisted Treatment, for people already struggling with opioid addiction
- Expand access and use of naloxone
- Promote use of state prescription drug monitoring programs
- Collaboration between state and local public health agencies, medical examiners and coroners, and law enforcement to examine trends of illegal opioid use
KNOW THE RISKS

AS MANY AS

1 IN 4 PEOPLE

receiving prescription opioids long term in a primary care setting struggles with opioid addiction.

MANAGE YOUR PAIN, MINIMIZE YOUR RISK.

Chronic pain can be devastating, and effective pain management is essential to get your life back. Talk to your doctor about ways to manage your pain that don’t involve prescription opioids, such as:

- Non-opioid pain relievers, such as acetaminophen (Tylenol®), ibuprofen (Advil®), or naproxen (Aleve®)
- Physical therapy and exercise
- Cognitive behavioral therapy
- Certain antidepressants and anticonvulsants

REFER TO THE CDC GUIDELINE FOR PRESCRIBING OPIOIDS FOR CHRONIC PAIN FOR RESPONSIBLE PRESCRIBING OF THESE DRUGS.

1 USE NONOPIOID THERAPIES
Don’t use opioids routinely for chronic pain. Use nonopioid therapies alone or in combination with opioids. Only consider opioid therapy if you expect benefits for pain and function to outweigh risks.

2 START LOW AND GO SLOW
When opioids are used, start with the lowest effective dosage and short-acting opioids instead of extended-release/long-acting opioids.

3 FOLLOW-UP
Regularly assess whether opioids are improving pain and function without causing harm. If benefits do not outweigh harms, optimize other therapies and work with patients to taper opioids.
