### **SECTION 3**

#### **3.1 SCOPE OF WORK**

The purpose of this Request to Qualify (RTQ) is to establish a pool of prequalified vendors to provide bird control services for Miami-Dade County departments.

#### **3.2 PURPOSE**

Bird control is the generic name for methods to eliminate or deter pest birds from landing, roosting and nesting. Bird control is important because pest birds can create health-related problems through their feces, including histoplasmosis (lung disease), cryptococcosis (a potential fatal fungus disease), and psittacosis (a contagious disease of birds, caused by chlamydiae and transmissible to human beings as a form of pneumonia). Bird droppings may also cause damage to property and equipment.

#### **3.3 DEFINING CHARACTERISTICS OF BIRD CONTROL SERVICES TO BE PROVIDED**

The following are a list of services to be provided, however, the list is neither exclusive nor complete.

1. Bird Netting: Bird netting is a net used to prevent birds from reaching certain areas.
2. Bird Repellents: Bird repellent are products which are proven in repelling many types of pest birds in a variety of situations and keeping birds away.
3. Bird Shock: Is a low-profile ledge deterrent system that is effective against all species of pest birds utilizing the principle of fear and flight, conditioning birds to stay away. Bird shock system use a harmless electric bursts, giving birds a non-lethal but effective conditioning to avoid areas.
4. Bird Spikes: Also known as an anti-roosting spike or roost modification, is a device consisting of long needle-like rods used for bird control. Bird control spikes can be attached to building ledges, street lighting, and commercial signage to prevent wild or feral birds from perching or roosting. The spikes are used to deter these birds without causing them harm or killing them.
5. Bird Trapping: Bird trapping is a flock dispersal bird control measure that can be effective at reducing bird populations. This control measure must be performed on a routine basis over a long period of time. Traps must be installed in areas where birds primarily feed. Prior to setting the traps, the birds should be feed for several weeks. Every trap must be well supplied with food and water. After the birds are used to feeding, the cages should be set. By allowing the birds to eat and freely enter and exit the traps, once the traps are set, a higher percentage of birds will be caught. After the traps are set, the traps should be check every two to three days so that the captured birds can be removed.
6. Tension Wire: Tension wire is used to deter birds from landing and/or roosting on exposed building elements by creating an unstable landing site; thus, forcing birds to move to other locations. Tension wire is a landing deterrent and not a barrier. The main component is a nylon coated stainless steel wire that has a spring tensioner attached between stainless steel posts. The main advantage of a tension wire system is that it is hard to see. The use of tension wire provides an effective, yet non-obtrusive method of

detering many bird species from landing, roosting and/or nesting on roof peaks/ledges, beams, pipes, signs and parapets.

7. **Visual Bird Deterrents:** Visual bird deterrents are used to frighten birds from treated areas with common scare triggers such as predator features or reflective surfaces. The birds see the bird deterrent and flee the area.
